

Scenario 1: *Amazon-style Electronics Store*

Question: Create an e-commerce homepage for an online electronics store. The page must include a navigation bar with product categories (Mobiles, Laptops, Accessories), a promotional banner section, and a product listing grid with a minimum of 6 products, each showing an image, product name, price, and an 'Add to Cart' button.

Scenario 2: *Zomato-style Food Ordering Site*

Question: Design a restaurant listing page for a food-ordering website. Include a search bar with a cuisine/rating filter that dynamically narrows the restaurant list, and link each restaurant card to a separate menu page listing at least 5 dishes with prices.

Scenario 3: *Myntra-style Fashion Portal*

Question: Build a user registration and login form for a fashion e-commerce portal. Implement client-side JavaScript validation for: valid email format, password strength (minimum 8 characters with a number and special character), 10-digit mobile number, and a 'confirm password' match check, with appropriate error messages.

Scenario 4: *BookMyShow-style Ticket Booking*

Question: Create a movie-ticket booking form using PHP that validates the selected show timing and number of seats, prevents a seat from being booked twice in the same session, and displays a confirmation message with a generated booking ID on successful submission.

Scenario 5: *Flipkart-style Marketplace*

Question: Implement a product catalog page for a general marketplace with category-wise search, a price-range filter, and a 'sort by price / rating' option, using JavaScript/PHP to dynamically update the displayed results without reloading the full page.

Scenario 6: *Swiggy-style Grocery App*

Question: Build a grocery item search module with an auto-suggestion (search-as-you-type) feature that displays matching product names as the user types, and lists the matched products with price and 'Add to Cart' option below the search bar.

Scenario 7: Netflix-style Subscription Platform

Question: Design a subscription payment page offering three plans (Basic, Standard, Premium) with feature comparison. On selecting a plan, simulate a payment gateway allowing the user to choose UPI, Card, or Net Banking, and display a payment success confirmation screen.

Scenario 8: IRCTC-style Ticket Portal

Question: Implement an e-payment module for a train-ticket booking system that generates a transaction summary (order ID, amount, date/time), and simulates both a payment-success and a payment-failure scenario with appropriate on-screen messages.

Scenario 9: BigBasket-style Grocery Cart

Question: Develop a shopping cart for a grocery website that allows the user to add/remove items and update quantities, dynamically recalculates the live total, and proceeds to a checkout page integrated with a mock payment option.

Scenario 10: Udemy-style E-Learning Platform

Question: Create an online course catalog page listing at least 5 courses with title, instructor, and price. Implement a course enrollment form and a simulated 'course progress' tracker that updates as the learner completes modules.

Scenario 11: Nykaa-style Beauty Store

Question: Build a product review and rating module for a beauty-products page, including a star-rating input and a comment box, with JavaScript validation ensuring a rating is selected and the comment is not empty before submission.

Scenario 12: Airbnb-style Booking Site

Question: Design a complete mini e-commerce flow for a property-booking site: a property listing page with search/filter by location and price, a booking form with validated check-in/check-out dates, and a payment confirmation page summarizing the booking and amount paid.
